

# Writing a full stack application

Dr. Peter Dillinger  
[peter.dillinger@email.de](mailto:peter.dillinger@email.de)

# Content

- Defining the application goal and architecture
- Development steps
  - Setting up the database
  - Implementing the backend and the frontend
  - Testing
  - Deploying
- Summary
- Literature and Sources
- Quiz

  year: "2003"
  cover: "https://covers.openlibrary.org/b/id/12521602-L.jpg"
▶ reviewIds: Array
```

```
_id: ObjectId('646bb1e2acab25490ddfea0f')
title: "Fantastic Mr. Fox"
▼ authors: Array
  0: "Roald Dahl"
  1: "Quentin Blake"
  isbn10: "0140306765"
  year: "1975"
  cover: "https://covers.openlibrary.org/b/id/12374431-L.jpg"
▶ reviewIds: Array
```

```
_id: ObjectId('646bb1e2acab25490ddfea10')
title: "The Kite Runner"
▶ authors: Array
```

```
@Document(collection = "books")
@Data
@AllArgsConstructor
@NoArgsConstructor
public class Book {

    @Id
    private ObjectId id;

    private String title;
    private List<String> authors;
    private String isbn10;
    private String year;
    private String cover;
    @DocumentReference
    private List<Review> reviewIds;
}
```

Book.java

Review.java

```
@Document(collection = "reviews")
@Data
@AllArgsConstructor
@NoArgsConstructor
public class Review {

    @Id
    private ObjectId id;
    private String text;

    public Review(String text) {
        this.text = text;
    }
}
```

Spring Boot Starter Data MongoDB

# Backend

fullstack\_db

```
GET /api/v1/books
GET /api/v1/books/{isbn10}
GET /api/v1/reviews
POST /api/v1/reviews, {isbn10,reviewText}
```

# Backend

```
@RestController
@RequestMapping("/api/v1/reviews")
public class ReviewController {
    @Autowired
    private ReviewService service;
```

REST endpoint (resource)

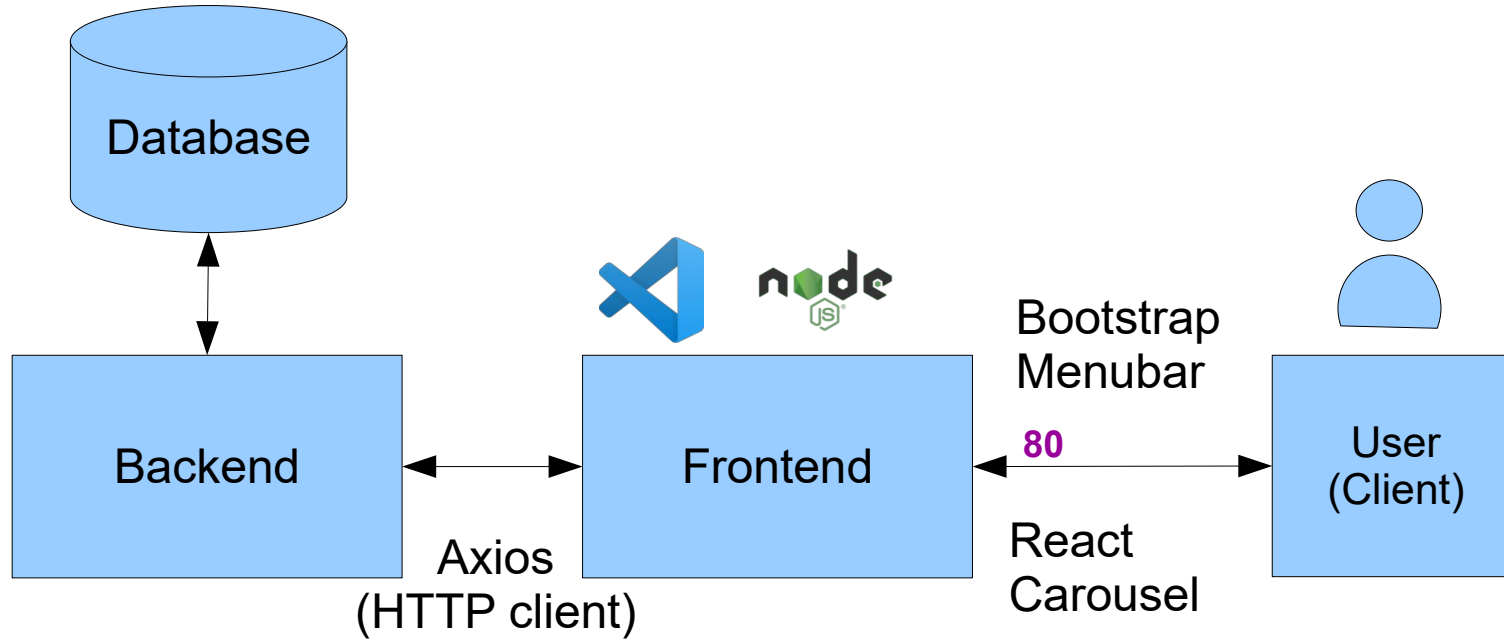

```
    @GetMapping
    public ResponseEntity<List<Review>> getReviews() {
        return new ResponseEntity<>(
            service.findAllReviews(), HttpStatus.OK);
    }
```

GET request on this resource  
will return all reviews of all books

```
    @PostMapping()
    public ResponseEntity<Review> createReview(@RequestBody Map<String, String> payload) {
        return new ResponseEntity<Review>(
            service.createReview(
                payload.get("isbn10"),
                payload.get("reviewText")
            ), HttpStatus.OK);
    }
}
```

POST request on this resource  
will create a new entry in the  
review collection

Really good book!

Is it working now?

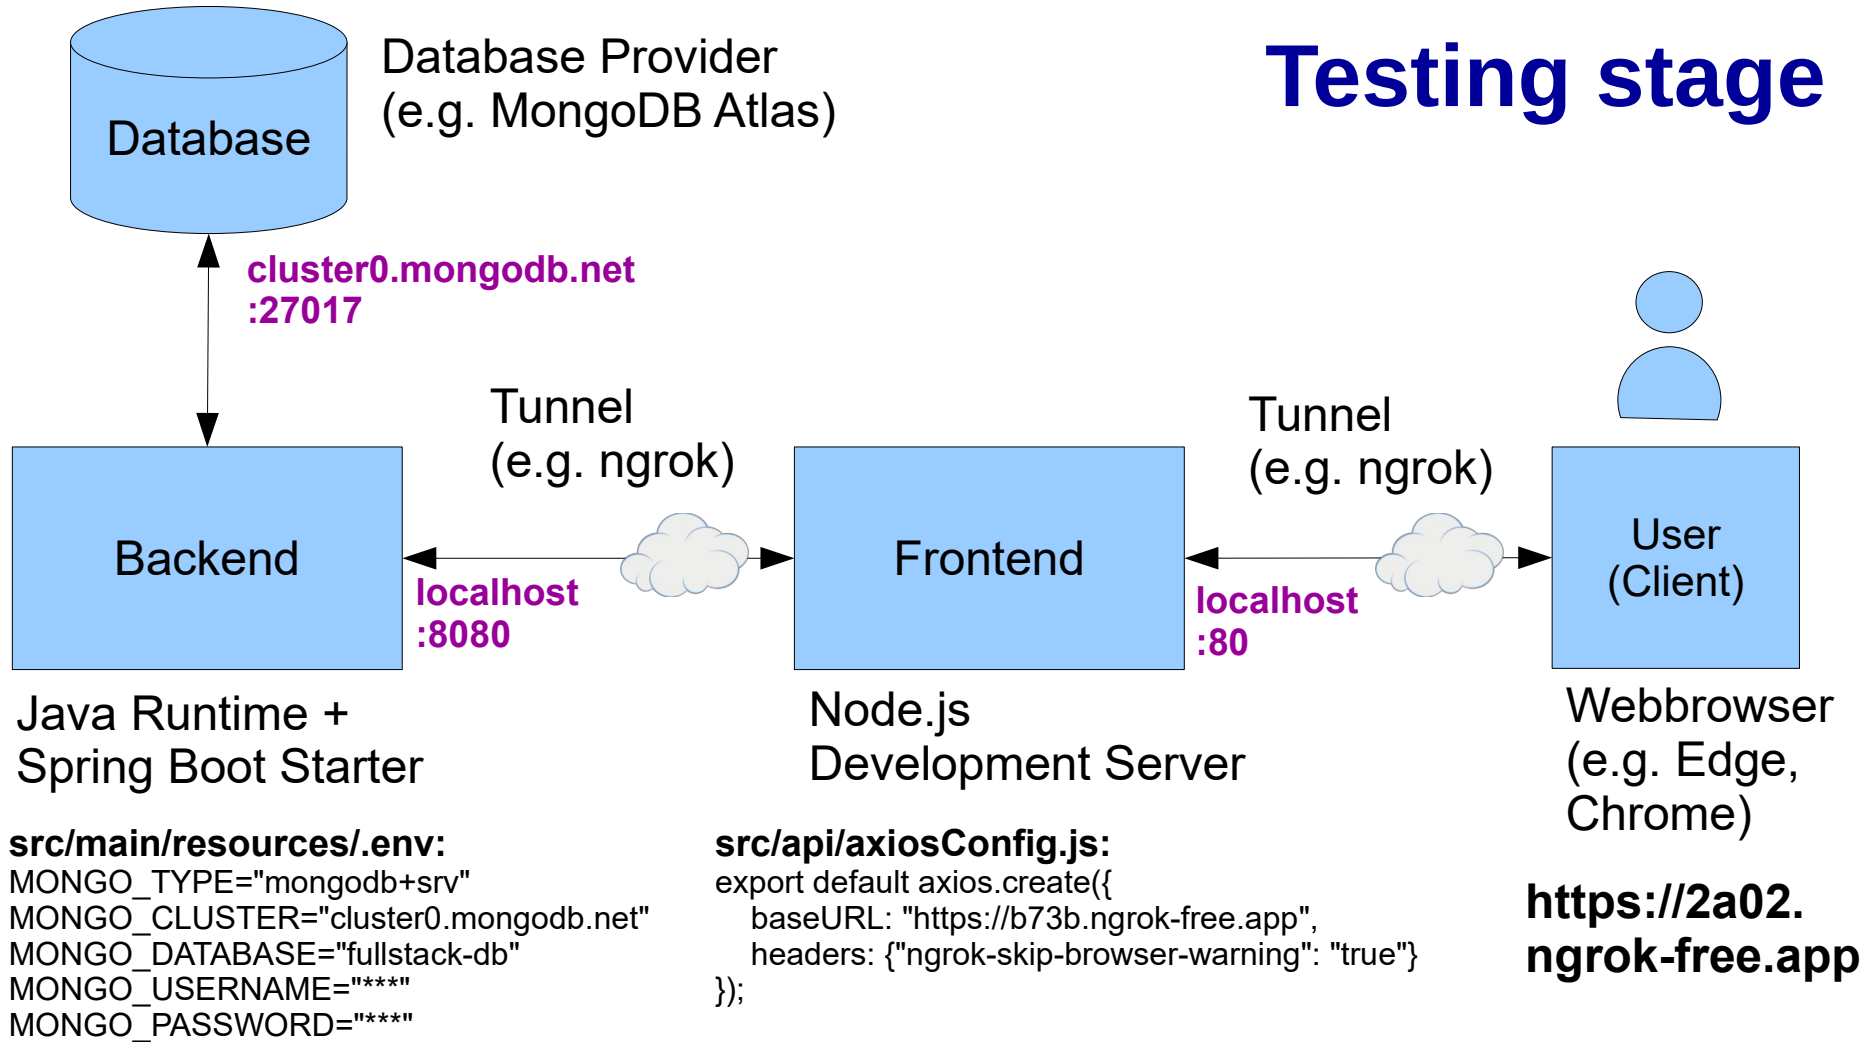

Nice :)

Row/Col Table

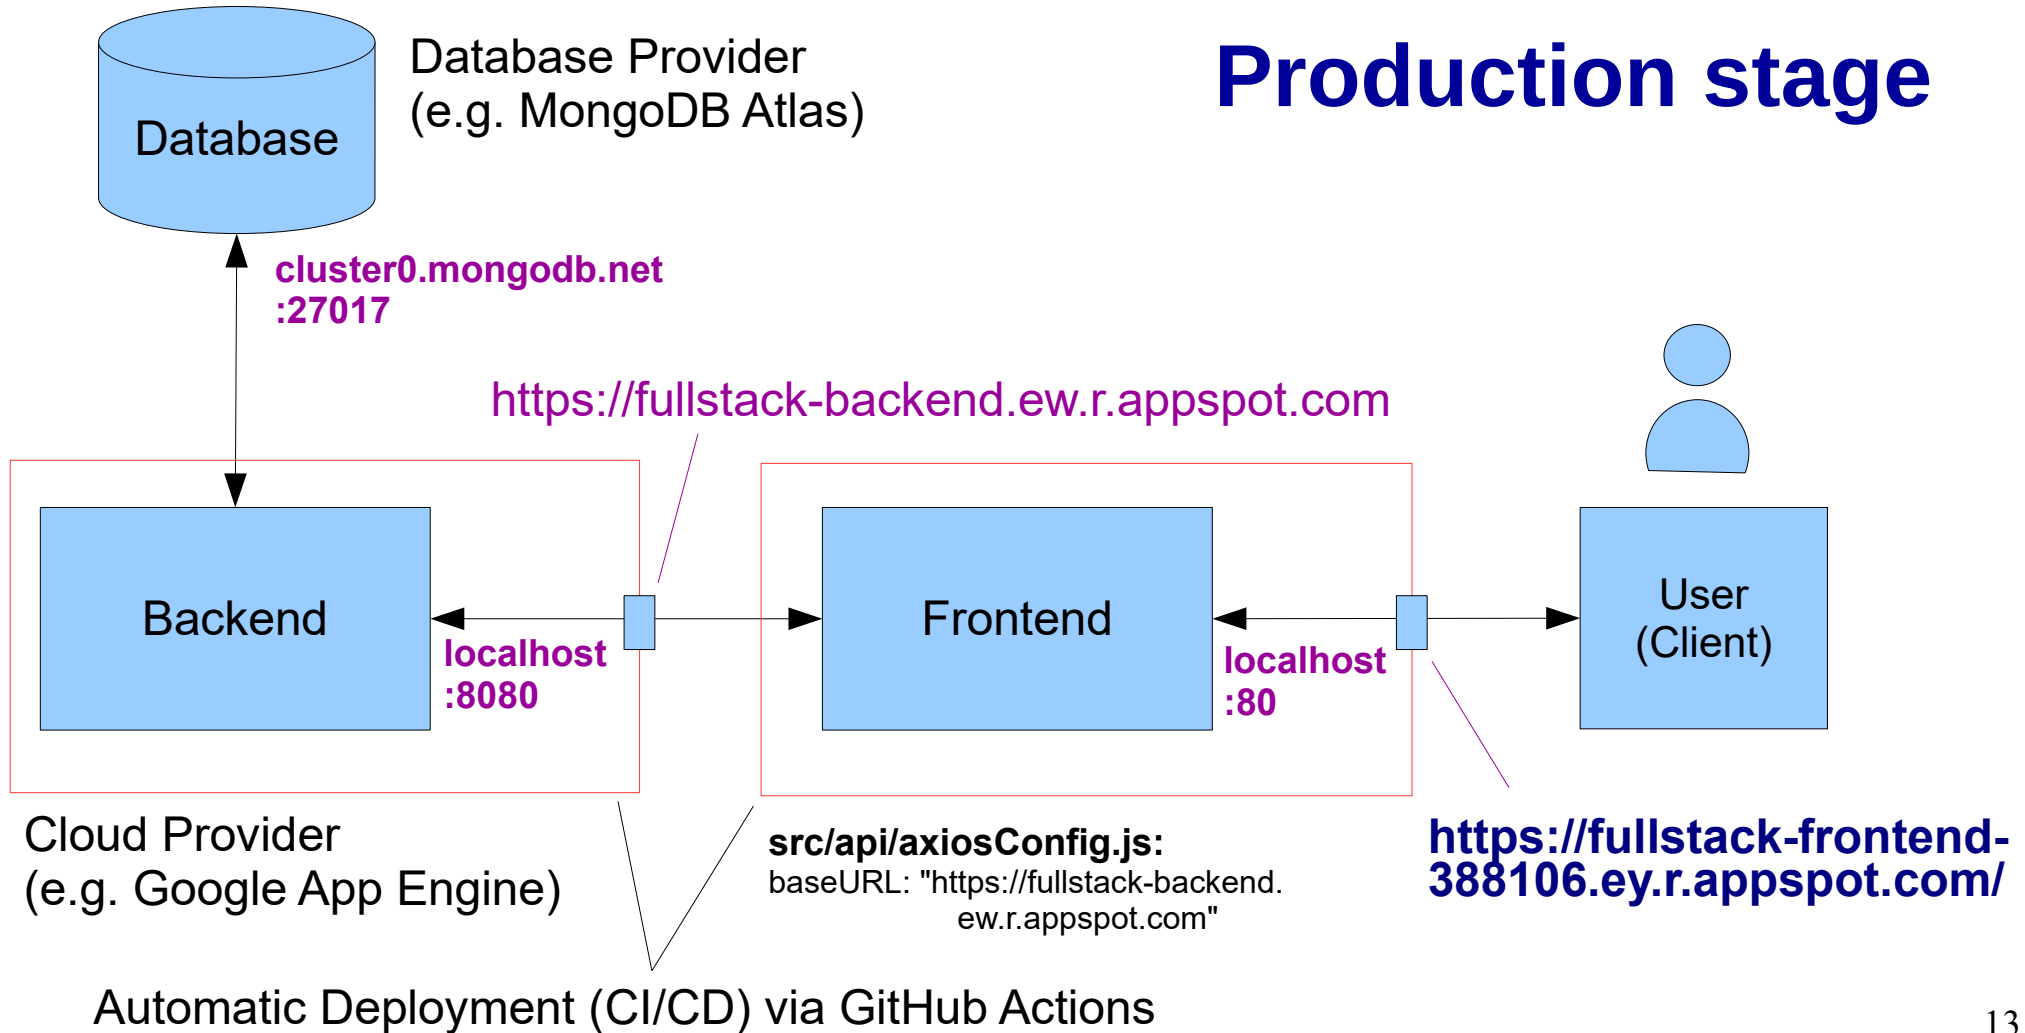

# Development stage

# Testing stage

# Production stage

# Summary

- Full stack applications consist of more than one layer: backend and frontend
- The development process has several steps
  - Defining the architecture model
  - Setting up the database (e.g. MongoDB)
  - Implementing the backend (e.g. Java, Spring Boot)
  - Implementing the frontend (e.g. Node.js, Bootstrap, React)
  - Testing and Deployment (e.g. Postman, GitHub Actions)
- Sometimes this process needs to be repeated (Agile Software Development)
